Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Duesterhoeft A., Floeth M., Fritz C., Heuss-Neitzel D.,

Hilbert H., Moestl D.,

Submitted (MAX-1996) to the EMBL/GenBank/DDBJ databases.

-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).

-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).

-!- SIMILARITY: Belongs to the ABC transporter family. PDRS subfamily.
                                                                                                                                                                                                                                                                                                                                      Gaps

Portetelle D., Puehler A., Purnelle B., Ramsperger U., Renard C., Thebault P., Vandenbol M., Weidner S., Galibert F.; Analysis of the chromosome sequence of the legume symbiont Scinorhizobium meliloti strain 1021."; Proc. Natl. Acad. Sci. U.S.A. 98:9877-9882(2001).

-!- FUNCTION: Negative regulator of class I heat shock genes (grpEdank-drand and groELS operons). Prevents heat-shock induction of these operons (By saimlarity).

-!- SIMILARITY: Belongs to the hrcA family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  InterPro, IPR0025/1; ........

"Complete genome sequence of Vibrio vulnificus CMCP6.";
Submitted (DEC-2002) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Probable chaperone. Has a low intrinsic ATPase activity which is markedly stimulated by hscB (By similarity).
-!- SIMILARITY: Belongs to the heat shock protein 70 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TISSUE=Testis;

cytoskeletal remodelling and signal tranduction.
-!-CATALYTIC ACTIVITY: Broad endopeptidase specificity.
-!-SIMILARITY: Belongs to peptidase family C2.
-!-SIMILARITY: Contains 1 Calpain catalytic domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       47812497BB315971 CRC64;

Preparation of a protein having 1A5B structure.

Claim 6; Fig 3; 27pp; Japanese.

The invention relates to a gene encoding a protein having a subunit structure of 1A5B in which the DNA sequence encoding each signal is deleted from the A subunit gene and the B subunit gene and they are combined tandemly in the order of (B subunit gene) - (SD sequence gene) - (A subunit gene). A method is provided for the preparation of a protein having a subunit gene) is mitch the above DNA is connected a vector expressible in Brevibacillus chosinensis and Brevibacillus chosinensis is transformed by said vector and said transformant is cultured. The present sequence represents the B. coli mutant heat-labile toxin (MLT) A subunit fragment, used for constructing a protein with the subunit structure of 1A5B

Sequence 237 AA;

ABB07778 standard; protein; 240 AA.

```
This sequence represents a fragment of an Escherichia coli heat labile toxin subunit A (LT-A). This protein is used in a method resulting in a munture LT-A protein which hea the wild type Ala residue at position 72 changed to an Arg residue resulting in a toxin which retains its immunogenicity but is detoxified. Detoxification is defined in the specification as a reduction in toxicity relative to wild-type toxin, such that any residual toxicity is sufficiently low to allow use as an effective immunogenic composition in humans without significant side caffects. The protein can be combined with an acceptable carrier in immunogenic compositions, optionally comprising an adjuvant and/or a second immunogenic antigen. Such compositions can be administered to prevent/treat disease in a subject e.g. traveller's diarrhoea in humans. The protein or compositions are especially administered as vaccines useful to prevent or treat infections by enterotoxigenic strain of E. coli in mammals (especially humans)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mutated Escherichia coli heat labile toxin subunit A - is immunogenic and detoxified relative to wild-type, useful e.g. in vaccines against E. coli enterotoxigenic strains and as an adjuvant.
                                                                                                                                                                                                                                                                                                                                         Heat labile toxin subunit A; LT-A; mutant; immunogen; detoxification; carrier; adjuvant; prevention; treatment; disease; diarrhoea; vaccine;

The invention relates to a gene encoding a protein having a subunit structure of 1ASB in which the DNA sequence encoding each signal is deleted from the A subunit gene and the B subunit gene and they are combined tandemly in the order of (B subunit gene) (SD sequence gene) subunit gene). A method is provided for the preparation of a protein having a subunit structure of 1ASB in which the above DNA is connected to a vector expressible in Brevibacillus chosinensis and Brevibacillus chosinensis and transforment is

                                                                                                                                                                                                                                                       AANSO205 is the gene sequence of the natural LTA gene. The LTA gene of the site directed mutant SDM1 (see AANSO206) is inactive. The inventors claim a vaccine prepr. active against pig scours which contains an inactivated LTA component, together with additional K88 antigens opt. with whole cells comprising the antigens or contg. the inactivated LTA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Heat-labile toxin; LT-A; LT-B; mutein; transgenic plant; vaccine; oral; adjuvant; anti-bacterial; S63K.
                                                                                                                                             AANSO205 is the gene sequence of the natural LTA gene. The LTA gene of the site directed mutant SDM1 (see AANSO206) is inactive. The inventors claim a vaccine prepr. active against pig scours which contains an inactivated LTA component, together with additional K88 antigens opt. with whole cells comprising the antigens or conig. the inactivated LTA. (Updated on 27-AUG-2003 to correct OS field.)
New toxoid as inactivated form of toxin for use in vaccines - is obtd. from organism transformed by gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotides encoding LT-A or CT-A polypeptides for the transformation of plant cells, useful in immunogenic compositions to elicit immune responses in animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAY96647 standard; protein; 259 AA.
```

```
This is mutant S63K Escherichia coli heat-labile toxin (LT) A subunit (LT a). The wild-type serine was replaced with lysine at residue 63 of the mature protein, which was caused by a codon change of TCC to AAG in the coding sequence. The sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to accomdate the creation of a NCoI restriction site around the initiator methionine codon. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enryme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant propertied and where at least one of the codons is altered to a plant propertied and where at least one of the codons is altered to a plant propuncleotides are useful for the transformation of plant cells for the production of transgenic plants for the prophylactic or therapeutic transment against E. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants. NB: This sequence does not appear in the specification, it was made from the wild type sequence shown in AAY96647,
                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Heat-labile toxin, LT-A, LT-B) mutant, transgenic plant, vaccine, oral, adjuvant, anti-bacterial, R192G.

```
This is mutant R192G Escherichia coli heat-labile toxin (IT) A subunit (IT-A). The wild-type arginine was replaced with glycine at residue 192 of the mature protein, which was caused by a codon change of TCC to AAG in the coding sequence. The sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to accomdate the creation of a NGOI restriction site around the initiator methionine codon. Novel polymuclectides encode a mutant LT-A polypeptide or a mutant vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide or a mutant codon. Novel polymuclectides encode a mutant LT-A polypeptide and where at least one of the codons is altered to a plant polypeptide and where at least one of the codons is altered to a plant coefferred codon. The polymucleotide further comprises a nucleic acid polymucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially coral vaccines in transgenic plants for the prophylactic or the prophylactic or the respecially creatment against E. coll or V. cholerae. The mutant polypeptides are specification, it was made from the wild type sequence shown in AAY96647,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Heat-labile toxin; LT-A; LT-B; mutant; transgenic plant; vaccine; oral; adjuvant; anti-bacterial.
         New polynucleotides encoding LT-A or CT-A polypeptides for the transformation of plant cells, useful in immunogenic compositions to elicit immune responses in animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

This synthetic Escherichia coli heat-labile toxin (LT) A subunit (LT-A) is encoded by a plant-codon optimized cDNA. The CDNA sequence contains plant-preferred codons and eliminates sequence motifie associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to accomodate the creation of a NGOI restriction site around the initiator methionine codon. Novel polymucleotides encode a mutant UT-A polypeptide or a mutant Vibrio cholerae cholerat toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polymucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polymucleotides are useful for the transformation of plant calls for the production of transgenic plants for the vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic reatment against E. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "the wild type arginine is replaced by glycine at position 192 of the mature sequence"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Heat-labile toxin; LT-A; LT-B; mutant; transgenic plant; vaccine; oral; adjuvant; anti-bacterial; A63K+R192G; double mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /label= S63K

This is Escherichia coli heat-labile toxin (LT) A subunit (LT-A) double mutant $63K-R192G. The wild-type serine was replaced with lysine at residue 63 and wild-type arginine was replaced with glycine at residue 192 of the mature protein. The coding sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding value) was made to accondate the creation of a Ncol restriction site around the initiator methiomine codon. Novel polymucleotides encode a mutant LT-A polypeptide or a mutant vibrio cholera cholera toxin (CT) A subunit (CT-A) colypeptide, which have reduced enzyme activity as compared to the wild-colypeptide and where at least one of the codons is altered to a plant preferred codon. The polymucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polymucleotides are useful for the transformation of plant cells for the production of transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant prophylactic compared the specification. It was constructed from the wild type LT-A subunit havye646 which is given in Figure 1 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                LT; heat-labile toxin; cholera toxin; CT; recombinant; adjuvant; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                          New polynuclectides encoding LT-A or CT-A polypeptides for the transformation of plant cells, useful in immunogenic compositions to elicit immune responses in animals.

Preparation of a protein having 1A5B structure.

Disclosure; Fig 9-10; 27pp; Japanese.

```
The invention relates to a gene encoding a protein having a subunit structure of 1A5B in which the DNA sequence encoding each signal is deleted from the A subunit gene and the B subunit gene and they are combined tandemly in the order of (B subunit gene) (SD sequence gene) - (A subunit gene). A method is provided for the preparation of a protein having a subunit structure of 1A5B in which the above DNA is connected to a vector expressible in Brevibacillus chosinensis and Brevibacillus chosinensis as transformed by said vector and said transformant is cultured. The protein can be used in the preparation of an adjuvant for vaccine. The present sequence represents the E. coli heat-labile toxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Heat-labile enterotoxin; LT; LTS63Y; LTdell110/112; mutant; detoxified and immunologically active protein; ADP-ribosylation; GB;

                                                                                                                                                                                                                                                                                                                  The invention relates to a gene encoding a protein having a subunit structure of 1ASB in which the DNA sequence encoding each signal is deleted from the A subunit gene and the B subunit gene and they are combined tandemly in the order of (B subunit gene) (SD sequence gene) subunit gene). A method is provided for the preparation of a protein a vector expressible in Brevibacillus chosinensis and Brevibacillus chosinensis as transformed by said vector and said transformant is cultured. The protein can be used in the preparation of an adjuvant for vaccine. The present sequence represents the E. coli mutant heat-labile
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LT; heat-labile toxin; cholera toxin; CT; recombinant; adjuvant; vaccine.

The present sequence represents Escherichia coli heat-labile enterotoxin (LT) mutant LTdel110/112. LTS63Y (AAU00506) and LTdel110/112 are two novel detoxified and immunologically active proteins (LT mutants) derived by site-directed mutagenesis of the Al subunit of wild type LT. The substitution of Ser to Tyr at position 63 in LTS63Y blocks NAD-binding. Deletion of Glu residues at positions 110 and 112 in LTdel110/112 eliminate the enzymatic activity of LT. The Al subunit of wild type LT catalyses ADP-ribosylation of Gs, a GTP-binding protein that regulates CAMP levels. The resulting increase in CAMP is the cause of diarrhee in
                                                                                                                                                                                                                                                                                                humans and animals e.g. pigs. The mucosal immunogenicities of mutant heat—
labile endotoxins LTS63Y and LTdell10/112 were tested. Groups of mice
were immunised with LTS63Y or LTdell10/112. The control groups received
phosphate buffered saline (PBS) alone. The serum and faecal antibody
titres to LT were determined. The results showed that mice immunised with
LTS63Y or LTdell10/112 contained high and comparable level of anti-LTR
antibodies in sera and faecal extracts comparable level of anti-LTR
antibodies in sera and faecal extracts comparable level of anti-LTR
wild-type LT. The LT mutants are useful as a vaccine for preventing and
treating diarrhoea and as an adjuvant for antibody production
New detoxified mutants of Escherichia coli heat-labile enterotoxin useful as vaccine for preventing and treating diarrhea, and as adjuvant for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Heat-labile enterotoxin; LT; LT863Y; LTdell10/112; mutant; detoxified and immunologically active protein; ADP-ribosylation; Gs; endotoxin; diarrhoea; mutein.

The present sequence represents Escherichia coli heat-labile enterotoxin (LT) mutant LTS63Y. LTS63Y and LTGell10/112 (AAU00507) are two novel detoxified and immunojogically active proteins (LT mutants) derived by site-directed mutagenesis of the Al subunit of wild type LT. The substitution of Ser to Tyr at position 63 in LTS63Y blocks NAD-binding. Deletion of Glu residues at positions 110 and 112 in LTGell10/112 eliminate the enzymatic activity of LT. The Al subunit of wild type LT catalyses ADP-ribosylation of Gs, a GTP-binding protein that regulates CMAP levels. The resulting increase in CAMP is the cause of diarrhoea in thumans and animals e.g. pigs. The mucosal immunogenicities of mutant heat clabile endotoxins LTS63Y and LTGell10/112 were tested. Groups of mice the endotoxins LTS63Y and LTGell10/112 were tested. Groups of mice protein the buffered saline (PBS) alone. The serum and faecal antibody titres to LT were determined. The results showed that mice immunised with those immunised with antibodies in sera and faecal extracts comparable level of anti-LT antibodies in sera and faecal extracts comparable level of anti-LT antibodies in sera and faecal extracts compared with those immunised with the treating diarrhoea and as an adjuvant for antibody production
                                                                                                                                                                                                                                New detoxified mutants of Escherichia coli heat-labile enterotoxin useful as vaccine for preventing and treating diarrhea, and as adjuvant for antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

This is the sequence of the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans. The sequence was published by Yamamoto et al. J.Biol. Chem., 259, 5037-5044. Mutations at selected positions within this sequence have been found to reduce toxicity (see AAR38730-R38732 and AAR4616-R44025). The invention relates to such against enterctoxified proteins and their use in vaccines to protect against enterctoxigenic E.coli. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                             Immunogenic detoxified mutant cholera toxin and heat labile toxin -

                                                                                                         The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al., J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-844025). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutein is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino acid numbering is based on the foller toxin A subunit sequence). (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.)

GENERAL INFORMATION:
APPLICANT: Domenighini, Mario
APPLICANT: Rino
APPLICANT: Rappuoli, Rino
APPLICANT: Pizza, Mariagrazia
TITLE OF INVENTION: Immunogenic Detoxified Mutants of
TITLE OF INVENTION: Their Use for the Toxin Lt, Their Preparation and
TITLE OF INVENTION: Their Use for the Preparation of Vaccines
NUMBER OF SEQUENCES: 41

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
